V-Cube: VoIP in a box

V-Cube™ is an IP-PBX that gives you a full range of communication services including voice, video, conferencing, call center, IVR and much more. It can do all of this across enterprise and public networks while providing a centralized interface for administration, provisioning and maintenance that doesn't take a mastermind to operate.

For service providers or enterprises, V-Cube offers the most flexible and cost-effective IP communications solution available. And because it's a software, not a hardware, based system it can be upgraded or updated easily with no capital expenditure.

Key features include:

- A highly scalable VoIP engine that serves an unlimited number of clients
- A software-only platform that means future upgrades and evolution are a standard part of the service
- Open standards and modular architecture enable the easy addition of new codecs and features as well as enhanced interoperability
- Real-time user and call control
- Built-in high-end functions such as Multi-domain handling, IVR, Call Center and Video calling
- Integrates easily with third party databases and applications as well as business processes
- Lowers your overall communication costs

The complete V-Cube solution includes the V-Cube server, the web interface and end-user devices.

Future-proof your investment

Because V-Cube is a software-only platform you can instantly create new services and features in response to changing customer needs or market dynamics. We've built it on open standards and open interfaces to offer scalability in three separate dimensions with complete vendor independence:

1. service and features offered
2. number of users supported
3. protocols and communication paradigms supported

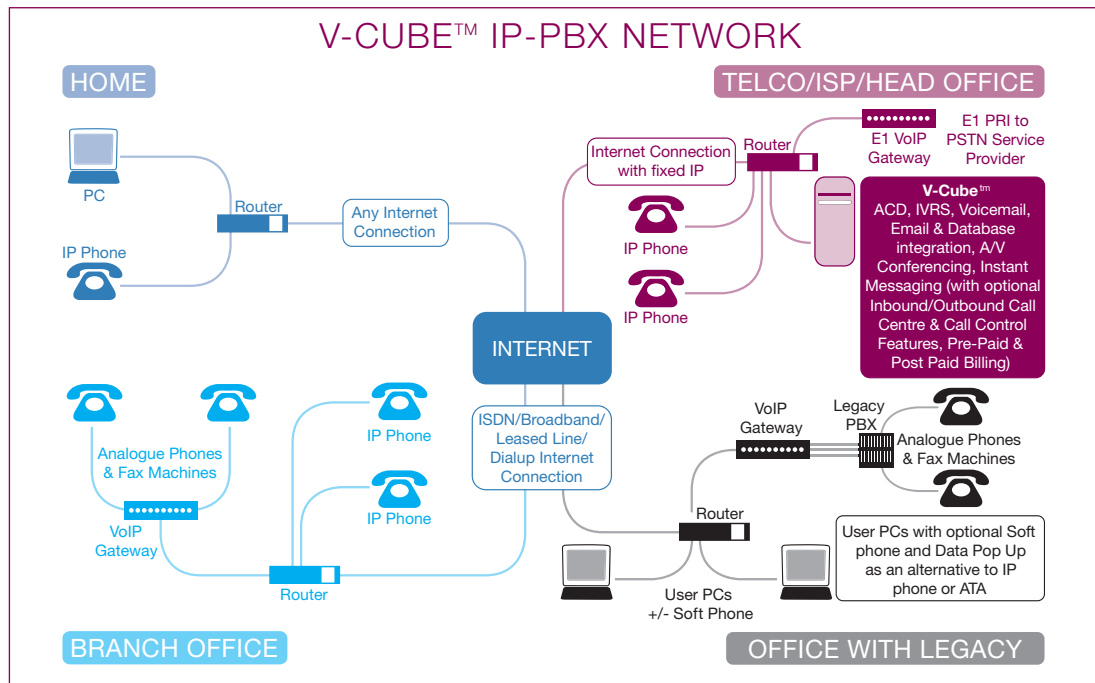

V-Cube has been developed with simplicity in mind, so anybody with basic software skills can administer it or turn on new features easily. Creating a new service or adding advanced features can be done in two minutes.

And we mean to deliver 100% availability so we used a building-block architecture together with the same hardware platform that powers airline flight-control systems.

All of this means that by choosing V-Cube you protect your company's position in the market while saving costs and ensuring long-term viability of your services.

V-Cube Overview

V-Cube IP-PBX Server

The V-Cube IP-PBX server offers scalable feature-rich call management and applications. It's complete with built-in SIP proxy, call and application manager and H.323 Inter gatekeeper functionalities within its open modular architecture supporting standard protocols and interfaces. And it can support standalone, peer-to-peer, master-slave and cluster configurations.

V-Cube Web Interface

The V-Cube administration interface is a web-based tool kit that manages provisioning, administration, maintenance and operations. Simple point and click actions can let you schedule conferences or monitor the communications infrastructure.

End User Devices

For maximum user flexibility, V-Cube IP-PBX can support any standards-based IP phone or VoIP Gateway. Or use V-Cube's embedded Soft Phone client, which provides extended data and converged communication capabilities. But even ordinary analogue phones can access advanced features like conferencing, transfer, forwarding and voice mail through DTMF without any specialized hardware, reducing your total deployment cost dramatically.
